

Cell Phones Have Become a Nuisance at Public Places

Statistics show that most car accidents are caused by the use of cell phones behind the wheel. "About 25-50 percent of car accidents are caused by the use of cell phones." Cell phone usage has gone up a lot over the last ten years. Public usage of cell phones is annoying and a distraction. Cell phones have definitely become a nuisance in public places.

First of all, cell phone usage in public is obnoxious. No matter where you go there will be someone using their phone. There is always that one person at the movie theater who is texting throughout the movie. There is also that one person at the restaurant who is talking loudly on their phone. "Thirty-nine percent of people say they frequently encounter someone using their phone in a loud obnoxious way." "Thirty-five percent of people say they occasionally encounter someone using their phone in an obnoxious way."

Secondly, cell phones are a distraction in public. Drivers are often distracted by their phones. They are texting, emailing, or talking while behind the wheel. "Studies show that three out of four drivers use their cell phones while being behind the wheel." Cell phones are not only a distraction to drivers; they are a distraction for everyone. When you are talking to someone and they are on their phone, they might not even be listening to you.

Some people may say that having cell phones in public are a form of safety and that they will have something to do if they are bored. However, cell phones cannot really keep you safe. You will be able to contact people in case of an emergency but you will not be able to do anything else after that. When you are bored you should not rely on your cell phone to keep you entertained because then you could become addicted to it.

In conclusion, cell phones are a nuisance in public places. Cell phones are annoying and they are a distraction. Cell phones can cause accidents and they are just really annoying when you are trying to talk to someone. Stop using your cell phone so much and actually do something like go outside or hang out with your friends.

Global Warming Does Not Exist

Seventy percent of people in America think Global Warming exists. Some researchers say there is a hole in the ozone layer it is making carbon dioxide heat up. They also say that the ice caps are melting and polar bears are dying. Researchers say that there is more rainfall than normal. They also say that temperatures are higher at any other time in human history, and sea temperatures are increasing as ice caps melt. Global Warming does not exist.

Global Warming is a lie propagated by scientists. They want you to believe that it exists. In Glen Beck's book "An Inconvenient Book" it told me that the scientists just want you to believe it so they changed their research to make you think its exist. A lot of scientists lie to make more profit because global warming is a great topic to discuss and they know that people will believe them if they just talk about carbon dioxide because carbon dioxide is warm. So they think it heats up the Earth.

The world has been heating and cooling for millions of years. It is a pattern, the world heats up it cools down, it heats up it cools down. There is no proof that the world has been heating and cooling because the earth does not show us. It shows us fossils but it does not show us the pattern of heating and cooling." Arctic means temperatures have barely changed since the start of their records in 1958. The Arctic was in fact warmer in the 1940s than it is now, but cooled between 1940 and 1980". The weather changes, it is part of living on Earth.

However, there is evidence of heating in the Earth. But, there is no proof to support this evidence. People like Ale Gor have supported global warming for many years. But, they do not have the proof they need to convince the public. There are as many supporters of global warming as there are of people who do not believe in it.

In conclusion, climate change is real, but predates humans. The planet has been heating and cooling, and water levels have been rising and falling for millions of years. Trying to climate change may prove more harmful to ecosystems that we do not fully understand. So by all means, do not pollute and do not be wasteful. Your behavior however, should be based on a sense of responsibility not because of you are afraid of killing the earth
